

Binary Information

Binary Name => VVSC

Language => C/C++

Arch => x86x64

Platform => Unix/Linux

\$ file VVSC

VVSC: ELF 64-bit LSB executable, x86-64, version 1 (SYSV), dynamically linked, interpreter /lib64/ld-linux-x86-64.so.2, for GNU/Linux 2.6.24, BuildID[sha1]=7ea0eace145e89811a030f9914f6637e69d29d66, not stripped

Analysis

Static Analysis

I opened my IDA to get a workflow diagram of what was happening. Below is the image of the workflow.

Program Workflow

- Takes numeric password as input
- Checks if the password is correct or not
- If password is correct then print **Allowed access** else **Access denied**

By checking the above image you probably have entered the password but still couldn't crack it, that's because the **password is in hex format**. Convert the password to decimal format and reenter it. You can convert it using online tools. I used gdb myself.

gef> p/d 0xd80b1

\$1 = 884913

gef>

Testing our input

```
$ ./VVSC
```

```
Enter the numerical password:
```

```
884913
```

```
Allowed access.
```

Yea!!! we were able to solve this crackme challenge.
